

SEO CASE STUDY

Serein Spaces

End-to-End SEO Growth Project

Client	Serein Spaces — sereinspaces.com
Industry	Commercial Interior Design, Office Interior Design & Office Fit-Out
Role	Freelance SEO Specialist / Consultant
Project Start	28 July 2026
Status	Ongoing
Prepared by	Ritik Yadav

1. Executive Summary

Serein Spaces is a commercial interior design and office fit-out company serving the Delhi NCR market, including Noida, Greater Noida and Gurgaon. The company designs and executes office interiors, workstation layouts and turnkey fit-out projects for corporate clients.

I have worked as the freelance SEO specialist on the sereinspaces.com account since 28 July 2026. The engagement is ongoing and covers the full SEO lifecycle: technical audit and remediation, indexing and crawl management, on-page and content SEO, structured data, analytics and tracking, local SEO, and off-page visibility building.

The approach has been audit-first: identify what is broken or under-optimized, fix or improve it in order of SEO impact, then build forward through content, schema and off-page work — all logged in a running work tracker so that every action has a documented problem, investigation, action and status.

At the seven-week mark, the account has moved from an unaudited site with several indexing and technical issues to a cleaner technical foundation (canonical, sitemap, noindex, 5xx and 404 issues resolved or actively tracked), structured data deployed across 40+ pages, a growing library of newly optimized and published blog content, a cleaned-up Google Tag Manager setup, and baseline organic performance data captured in Google Search Console and GA4 for ongoing measurement.

This document presents the actual scope of work performed, the reasoning behind each decision, and the real data available at this stage of the project — without projecting results the data does not yet support.

2. Client & Project Overview

Field	Detail
Client	Serein Spaces
Website	sereinspaces.com
Industry	Commercial Interior Design, Office Interior Design and Office Fit-Out
Project Type	End-to-end freelance SEO engagement
My Role	Freelance SEO Specialist / Consultant — sole SEO owner on the account
Timeline	28 July 2026 — ongoing
Main SEO Objectives	Technical health, indexing coverage, content & topical authority, local visibility, lead tracking

3. SEO Objectives

The engagement was scoped around eight core objectives:

- Improve organic visibility for core service and location-based search terms across Noida, Greater Noida, Gurgaon and Delhi NCR.
- Improve technical SEO health — crawlability, indexing eligibility and canonicalization.
- Improve indexing coverage and reduce non-indexed, duplicate or orphaned URLs.

- Strengthen content quality across service, blog and location pages through a standardized SEO content workflow.
- Build topical authority in commercial and office interior design through consistent, intent-matched blog publishing.
- Improve local search visibility across the company's core service regions.
- Establish reliable lead and conversion tracking through GA4 and Google Tag Manager.
- Build a sustainable, well-documented SEO foundation for long-term, compounding growth.

4. Initial SEO Audit & Key Findings

The first two weeks (28 July – 8 August) were spent on a full technical and indexing audit. Findings are grouped below by category, using a Problem → Investigation → Action → Status format.

Technical SEO

- Problem: A duplicate /index URL was competing with the homepage with no user-selected canonical. Investigation: Found in the GSC coverage report. Action: Canonical corrected so /index resolves to the homepage. Status: Done (4 Aug).
- Problem: /interior-design-technologies-modern-offices-2026 was returning a 5xx server error. Investigation: Flagged in GSC coverage. Action: Escalated to the developer and fixed, then resubmitted for indexing. Status: Done (18 Aug).
- Problem: A malfunctioning page was causing 13 URLs to return 404 errors. Investigation: Traced through GSC and manual crawl checks. Action: Page removed and the 13 affected URLs monitored. Status: Done (18 Aug).
- Problem: 65 legacy .php URLs (old project, service and blog pages) were carrying redirects of mixed quality. Investigation: Reviewed each redirect target in GSC's "Page with Redirect" report. Action: Verifying each redirect target; obsolete pages are being flagged for a 410 response rather than a soft redirect. Status: In progress.

Indexing

- Problem: 38 URLs showed "Crawled – currently not indexed." Investigation: Reviewed each page for content quality and relevance signals. Action: Prioritized for content review and internal linking improvements. Status: Ongoing.
- Problem: 13 URLs showed "Discovered – currently not indexed," mostly blog and service pages. Investigation: Reviewed indexing eligibility for each. Action: Requested indexing individually through GSC after review. Status: 11 of 13 resolved by 18 August; remainder under review.
- Problem: A recurring backlog of unnecessary non-indexed, duplicate or legacy URLs kept appearing in coverage reports. Investigation: Identified 9 low-value URLs across two clean-up passes. Action: Removed 6 URLs on 7 September and a further 3 on 11 September. Status: Done; monitoring Google's recrawl.

URL / Canonical Issues

- Problem: The site logo/header linked to the www version (<https://www.sereinspaces.com/>) while the site's preferred domain is non-www, creating an unnecessary redirect hop. Investigation: Found during an internal link and header review. Action: Corrected the logo link to the non-www URL. Status: Done (13 Aug).

- Problem: /index was flagged as a duplicate without a user-selected canonical. Investigation: Confirmed in the GSC coverage report. Action: Canonical defined. Status: Done.

Internal Linking

- Problem: The blog's "Recent Posts" sidebar module was linking to the wrong articles on the blog listing page. Investigation: Found by manually testing sidebar links (4 Aug). Action: Flagged for a template/backend fix. Status: A follow-up internal linking audit on 27 August found the same module still pointing to outdated .php URLs instead of current blog URLs — correction re-requested and awaiting verification.

Sitemap

- Problem: The XML sitemap contained duplicate URLs, reducing crawl efficiency. Investigation: Manual sitemap review after the initial submission. Action: Regenerated the sitemap without duplicates and re-submitted an updated sitemap.xml as new content was added (14 Aug and 18 Aug). Status: Done; sitemap crawlable and monitored in GSC.

Analytics / Tracking

- Problem: Needed confirmation that lead-related conversion events were firing correctly. Investigation: Reviewed GA4 events including form_submit and contactus_lead. Action: Verified event tracking and began ongoing monitoring of lead-related events. Status: Ongoing.
- Problem: Google Tag Manager still held tags tied to the old .php URL structure, while several current URLs were untagged. Investigation: Full GTM tag/trigger audit against the current URL structure. Action: Removed all untagged legacy .php URL tags and added tags for the current, previously untagged URLs. Status: Done (10 Sep); monitoring ongoing.

Content SEO

- Problem: Obsolete <meta name="keywords"> tags were present across the Services, Projects and Blog templates. Investigation: Identified across shared templates. Action: Documented the affected pages and exact code, and shared this with the developer for removal. Status: Flagged (7 Aug); removal handled by the development team.
- Problem: Keyword cannibalization was identified between overlapping pages, including "Office Interior Design Ideas." Investigation: Reviewed target keywords and search-intent overlap. Action: Adjusted keyword targeting and content angle to reduce overlap. Status: Done; monitoring rankings.
- Problem: Several blog pages were missing FAQs, reducing their chances of Featured Snippet or AI Overview visibility. Investigation: Content-gap review against competitor and AI Overview research. Action: Added structured FAQs in a consistent format. Status: Done; rollout ongoing across further pages.

5. Technical SEO Work

Technical SEO has been an ongoing, weekly discipline rather than a one-time fix. Work performed to date includes:

- 404 review — identified and tracked 404 URLs (including /index.html), deciding case-by-case between a redirect and a 410 response.
- 5xx server error resolution — identified the server error on /interior-design-technologies-modern-offices-2026, coordinated the fix with the developer, and verified recovery.

- Noindex audit — found and corrected an unintended noindex tag on /how-to-design-open-plan-office after confirming it was not intentional.
- Canonical review — audited canonical tags across key pages and corrected the duplicate /index issue.
- Duplicate /index resolution — set a clear canonical so /index no longer competes with the homepage.
- Legacy .php URL review — audited 65 old .php URLs from earlier site structures, verifying redirect targets and identifying obsolete pages for a 410 response.
- Sitemap audits and updates — reviewed sitemap quality, removed duplicate entries, and created/submitted updated sitemap.xml files on two occasions as content was added.
- Internal linking problems — identified the "Recent Posts" sidebar linking to incorrect and outdated .php articles, and requested a template-level fix.
- URL consistency — corrected the site logo/header link from the www to the non-www version to remove an unnecessary redirect.
- Indexing issue resolution — worked through noindex, 5xx and duplicate-canonical issues surfaced in GSC coverage reports.
- Discovered-not-indexed URLs — reviewed and requested indexing for 13 affected URLs, resolving 11 by 18 August.
- Favicon and logo implementation — fixed the site favicon and logo setup for correct brand display in Google Search results, and validated related structured data.
- Google Tag Manager URL cleanup — removed tags tied to the retired .php URL structure and tagged current URLs that were missing tracking.

6. Indexing & Crawl Management

Indexing has been managed directly through Google Search Console on a recurring basis. The initial coverage audit (11 August snapshot) logged the following issue categories:

Issue	URLs Affected	Status
Not Found (404)	1	Reviewed
Page with Redirect	65	Verifying targets
Excluded by noindex	1	Resolved
Duplicate without user-selected canonical	1	Resolved
Crawled – currently not indexed	38	Ongoing review
Server Error (5xx)	1	Resolved
Discovered – currently not indexed	13	11 of 13 resolved
Alternate page with proper canonical	0	No action needed

Work performed against this coverage picture included:

- Coverage review — recurring, near-weekly review of the full GSC coverage report (29 July, 10, 12, 17, 18, 25 August; 1, 2, 6, 12 September) to catch new issues early.

- Discovered-not-indexed clean-up — resolved 11 of 13 flagged URLs by 18 August through content and indexing review.
- Noindex and duplicate-canonical resolution — resolved the single noindex and duplicate-canonical issues identified in the initial audit.
- URL removals — removed 6 unnecessary non-indexed URLs on 7 September and a further 3 on 11 September, reducing clutter in coverage reports.
- Indexing submissions — submitted the URLs affected by the 5xx error and the noindex issue for re-indexing once fixed (14 August).
- Sitemap submissions — submitted an updated, deduplicated sitemap.xml on 14 August and again on 18 August, verifying Google could crawl it both times.
- Monitoring and validation — ongoing monitoring of indexing status for both newly published pages and previously flagged URLs, most recently reviewed 12 September.

The 38 "Crawled - currently not indexed" URLs and the 65 legacy redirect URLs remain under active review and are the current focus of indexing work.

7. Content SEO Strategy

From 5 August onward, every blog on the account has followed a standardized SEO content workflow rather than an ad-hoc approach. For each topic, the process covers:

- Keyword research — identifying primary and supporting keywords for each topic.
- Search intent analysis — confirming the content angle matches what searchers actually want (informational, cost/planning, comparison, etc.).
- Competitor analysis — reviewing how ranking competitors structure and cover the same topic.
- Google AI Overview research — checking how AI Overviews currently summarize the topic, to inform content structure and phrasing.
- Featured Snippet opportunities — identifying question-and-answer or list/table formats that could win snippet placement.
- Semantic SEO and content briefs — building a brief covering subtopics, entities and related terms before writing.
- Heading structure — planning H1/H2 hierarchy around search intent and target keywords.
- Metadata — writing title tags and meta descriptions aligned to search intent.
- FAQ research — identifying real, commonly asked questions to add as structured FAQ sections.
- Internal linking — connecting new and existing content to relevant service and location pages.
- Existing content optimization — revisiting and improving already-published blogs rather than only creating new ones.
- Keyword cannibalization checks — reviewing overlapping pages (e.g. "Office Interior Design Ideas") and adjusting targeting to avoid competing against the company's own content.

Applying this workflow, 3 new blogs were written on 22 August and a further 2 drafted on 28 August; 3 previously published blogs were re-optimized on 24 August; the "Modern Office Table Designs" blog was optimized on 21

August alongside the cannibalization fix; and the Boq Fit-Out blog was reviewed and updated with content and FAQ improvements, and is now indexed and being monitored.

8. SEO Content Projects

The table below shows a selection of the most recent blog pages worked on. All five followed the standardized content workflow described in Section 7. No individual ranking or traffic results are claimed for these pages at this stage — they are shown as examples of process and execution.

Page / Topic	SEO Objective	Work Performed	SEO Elements Implemented
Office Interior Design in Gurgaon: Planning Better Workspaces	Build topical and local relevance for Gurgaon-based commercial interior design searches	Keyword research, search intent and competitor/AI Overview research; on-page structure and metadata; FAQ additions; internal linking to Gurgaon service content	Optimized H1/H2 structure, metadata, FAQ content, internal links
BOQ for Office Fit-Out: Cost Planning & Budget Control	Target cost/budget-planning search intent for office fit-out buyers	Search intent analysis for a cost-planning topic; content brief covering BOQ components; metadata and heading structure; syndicated for visibility	Intent-matched structure, metadata, cost-planning content sections
Modern Office Interior Design Ideas for Functional Workspaces	Support topical authority around modern office design ideas	Keyword and competitor research; content structure and metadata optimization; FAQ review; distributed across syndication platforms	On-page optimization, FAQ content, metadata
Commercial Office Fit-Out Process, Costs & Planning	Capture process- and planning-stage search queries for fit-out projects	Content brief and heading plan for a process/cost topic; metadata; guest placement on businessnewsplace.com for added visibility	Structured process content, metadata, external syndication
Corporate Interior Design: Planning a Better Modern Workplace	Strengthen the corporate/commercial design content cluster	Keyword and intent research; content and heading structure; metadata; internal linking; syndicated across content platforms	On-page optimization, metadata, internal links

9. Structured Data & Schema Implementation

Structured data (schema.org markup) has been implemented across the homepage, About and Contact pages, and more than 40 blog, service and city-location pages. The schema types used include:

- **WebPage** — applied to core pages such as the homepage, About and Contact, to clearly define page type and purpose.
- **BlogPosting** — applied across blog content to mark up article structure, headline and publish information.
- **Person** — applied to author-related content to establish authorship.
- **BreadcrumbList** — applied to support clear site hierarchy in search results.

- FAQPage — applied to blog pages with structured FAQ sections, aligned with the FAQ content described in Section 7.

Schema for newly published pages is prepared and validated using Google's Rich Results Test before being considered complete — for example, schema for 4 new blog pages was validated this way on 26 August, with the same validation step applied to further pages as they are published.

Structured data helps Google understand page type, authorship, hierarchy and FAQ content more reliably. It does not guarantee specific rankings or that a rich result will appear in the search results — it is implemented to support search understanding, not to promise a visual outcome.

10. Analytics & Tracking

Google Search Console

Snapshot for 5–11 September 2026:

113 CLICKS	~15.1K IMPRESSIONS	0.7% CTR	17.4 AVG. POSITION
----------------------	------------------------------	--------------------	------------------------------

GA4

Snapshot for 7–13 September 2026:

3,587 TOTAL EVENTS	401 USERS	1,257 PAGE VIEWS	589 SESSION STARTS
------------------------------	---------------------	----------------------------	------------------------------

397 PAGE-VIEW USERS	860 ENGAGEMENT EVENTS	459 SCROLL EVENTS	370 / 366 FIRST VISITS (EVENTS/USERS)
-------------------------------	---------------------------------	-----------------------------	---

GA4 Metric	Value
Form starts	25 events / 4 users
Form submits	12 events / 2 users

Verified Business Leads

3 VERIFIED BUSINESS LEADS

Important distinction: GA4 form-start and form-submit events are engagement signals, not confirmed leads. Of the 12 recorded form-submit events, 3 have been verified as genuine business leads by the client. The two figures are reported separately and should not be read as equivalent.

Google Tag Manager

GTM was audited and cleaned up on 10 September: all tags associated with the retired .php URL structure were removed, and tags were added for current URLs that were not yet being tracked. This keeps GA4 event data aligned with the site's actual live URL structure going forward.

11. Search Performance

The table below repeats the verified Google Search Console data for the most recent available week. This is a single snapshot early in an ongoing project, not a before/after comparison, and no ranking or traffic improvement is claimed from it in isolation.

Metric	Value	Period
Clicks	113	5–11 Sep 2026
Impressions	~15.1K	5–11 Sep 2026
CTR	0.7%	5–11 Sep 2026
Average Position	17.4	5–11 Sep 2026

A page-level and query-level breakdown was not part of the data provided for this snapshot and is therefore not included here. As indexing and content work continues, this section will be updated with trend data across multiple weeks rather than a single snapshot.

12. Off-Page SEO

Off-page work began on 29 August and has continued on a rolling basis (30 August; 9 and 13 September, and ongoing). For each newly published blog, supporting assets and summaries were distributed across a mix of platforms to build brand visibility, content discoverability and supplementary indexing signals:

- Visual/portfolio platforms — Behance, Dribbble, 500px and Pinterest, used to showcase project visuals linked back to the corresponding blog.
- Micro-publishing and bookmarking platforms — Medium, Tumblr, Telegra.ph, JustPaste.it, Diigo, Penzu, LiveJournal, Notion and Scoop.it, used to republish or summarize blog content with a link back to the source.
- Document and presentation sharing — SlideServe and FlipHTML5, used to host longer-form versions of select content.
- One guest-article placement — published on businessnewsplace.com.

Each submitted link is reviewed for topical relevance before publishing, and low-value or irrelevant platforms are avoided.

These platforms are treated as content syndication and brand-visibility channels rather than high-authority editorial backlinks. They have not been described as authoritative link sources, and no ranking impact is claimed from off-page work

at this stage — link relevance and quality continue to be reviewed as part of a longer-term, sustainable backlink-building process.

13. Key SEO Issues Identified & Resolved

Issue	SEO Impact	Action Taken	Status
Duplicate /index URL, no user-selected canonical	Wasted crawl budget; possible duplicate-content signal	Canonical corrected to homepage	Resolved
5xx error on a key blog URL	Blocked indexing and access to the page	Fixed with developer; resubmitted for indexing	Resolved
Unintended noindex on a published page	Page excluded from Google's index	Confirmed unintentional, removed noindex, re-indexed	Resolved
Page rendering error causing 13 URLs to 404	Broken pages returning errors to users and Google	Removed the faulty page; monitored affected URLs	Resolved
13 URLs "Discovered – currently not indexed"	Pages not entering the index despite being found	Reviewed and requested indexing individually	11 of 13 resolved
38 URLs "Crawled – currently not indexed"	Content crawled but not considered index-worthy yet	Prioritized for content and internal-link review	Ongoing
65 legacy .php URLs with mixed redirects	Inefficient crawl paths; unclear signal on old content	Verifying redirect targets; obsolete pages flagged for 410	In progress
"Recent Posts" module linking to outdated .php URLs	Dilutes internal linking and passes users/crawlers to dead structure	Flagged for template fix; re-flagged after follow-up audit	In progress
Logo linking to www instead of non-www URL	Unnecessary redirect hop on every page load	Corrected link to non-www URL	Resolved
Obsolete meta keywords tags across templates	No SEO value; unnecessary maintenance overhead	Documented and shared with developer for removal	Resolved
Keyword cannibalization on overlapping pages	Pages competing against each other for the same intent	Adjusted targeting and content angle	Resolved, monitoring
Untagged current URLs / legacy tags in GTM	Incomplete or inaccurate tracking data	Removed legacy tags, added tags for current URLs	Resolved
9 unnecessary non-indexed URLs in coverage reports	Clutter in coverage data, reduced signal clarity	Removed in two passes (6 + 3 URLs)	Resolved

14. SEO Workflow

Work on this account follows a consistent, repeatable cycle:

- Audit — regular technical and indexing audits using GSC coverage reports and manual site review.

- Research — keyword, search intent, competitor and AI Overview research for content and page-level decisions.
- Prioritization — issues are ranked by SEO impact; anything blocking indexing (5xx, noindex, canonical conflicts) is fixed before lower-impact work.
- Implementation — fixes and content are implemented directly or coordinated with the developer for template-level changes.
- Validation — changes are checked (e.g. Rich Results Test for schema, manual URL checks for redirects and canonicals) before being marked done.
- Monitoring — GSC and GA4 are reviewed on a near-weekly basis to catch regressions or new issues early.
- Reporting — every action is logged in a running work tracker with date, category, finding and recommendation.
- Continuous Optimization — resolved items are revisited (e.g. the internal linking module was re-flagged after a follow-up audit), and the cycle repeats.

An example of this cycle in practice: the 5xx error on a key blog URL was found during a routine coverage audit, prioritized immediately because it blocked indexing, fixed in coordination with the developer, validated by resubmitting the URL in GSC, and then monitored in the following weeks until indexing was confirmed.

15. Tools & Platforms

- Google Search Console — indexing, coverage, and search performance monitoring.
- Google Analytics 4 (GA4) — user behavior, engagement and conversion event tracking.
- Google Tag Manager (GTM) — tag and tracking management across the current URL structure.
- SEMrush — keyword and competitor research.
- Ubersuggest — supplementary keyword and content research.
- Google Rich Results Test — schema validation before publishing.
- Schema.org markup — WebPage, BlogPosting, Person, BreadcrumbList and FAQPage structured data.

16. Current SEO Strategy & Next Steps

As of mid-September, the following work is active and ongoing:

- Continued indexing monitoring for the remaining "Crawled – currently not indexed" URLs (38) and the legacy redirect batch (65 URLs).
- Ongoing content optimization of existing blog and service pages, including further FAQ and internal linking additions.
- New blog creation following the standardized content workflow, with drafts already in progress.
- Continued schema implementation and Rich Results Test validation as new pages are published.
- Re-verification of the internal linking fix for the "Recent Posts" module to confirm it now points to current blog URLs.

- Continued backlink building and content syndication, with an emphasis on reviewing relevance before publishing.
- Ongoing GSC and GA4 monitoring on a near-weekly cadence.
- CTR and average-position analysis — the current 0.7% CTR and 17.4 average position point to significant room for improvement as indexing and content work matures.
- Continued lead tracking through GA4 and GTM, distinguishing engagement events from verified business leads.

17. Key Takeaways

This project demonstrates the ability to independently own and run an SEO account end-to-end, including:

- Independent project ownership — sole SEO owner on the account since day one, managing the full scope without a larger in-house team.
- Technical troubleshooting — diagnosing and resolving 404, 5xx, noindex, canonical and sitemap issues, often in coordination with a developer.
- Data analysis — using GSC coverage and performance data, and GA4 behavior and event data, to prioritize work.
- Content strategy — building and applying a standardized keyword, intent, competitor and AI Overview research workflow to every piece of content.
- Implementation — executing on-page changes, schema markup and structured FAQs directly.
- Client and developer communication — documenting findings clearly enough to hand off template-level fixes and confirm intentional vs. unintentional issues (e.g. the noindex tag).
- Cross-functional coordination — working across content, technical, analytics and off-page workstreams within a single account.
- Continuous SEO monitoring — a documented, recurring cadence of audit, fix, validate and monitor rather than a one-time project.
